Claims 1-7

Please cancel claims 1-7.

Claim 8

8. (Currently Amendment) ~~The method of claim 1,~~ A method of providing content to a device according to Hypertext Transport Protocol (HTTP), the method comprising:
receiving an HTTP request for a first content object;
identifying a content operation identifier that identifies a corresponding second content object determined as relevant to the first content object by a

predictive caching operation, the content operation identifier including a directive for prefetching the second content object as a content operation distinct from presentation of the first content object by the device; and sending to the device an HTTP response to the HTTP request, the HTTP response including the first content object and the content operation identifier, enabling the device to perform the prefetching of the second content object based on receipt of the content operation identifier and distinct from the presentation of the first content object;

wherein the sending step includes adding to the first content object a content operation tag that specifies the content operation identifier including a directive tag specifying the corresponding content operation to be performed by the device and an object identifier that specifies a location of the second content object.

Claim 9

9. (ORIGINAL) The method of claim 8, wherein the first content object is a Hypertext Markup Language (HTML) document, the adding step including inline prepending the content operation tag into the HTML document.

Claim 10

10. (PREVIOUSLY PRESENTED) The method of claim 9, wherein the content operation identifier further includes a second directive tag specifying purging a third content object from a cache.

Claim 11

11. (CURRENTLY AMENDED) ~~The method of claim 1,~~ A method of providing content to a device according to Hypertext Transport Protocol (HTTP), the method comprising:

receiving an HTTP request for a first content object;

identifying a content operation identifier that identifies a corresponding second content object determined as relevant to the first content object by a predictive caching operation, the content operation identifier including a directive for prefetching the second content object as a content operation distinct from presentation of the first content object by the device; and

sending to the device an HTTP response to the HTTP request, the HTTP response including the first content object and the content operation identifier, enabling the device to perform the prefetching of the second content object based on receipt of the content operation identifier and distinct from the presentation of the first content object;

wherein the sending step includes inserting into the HTTP response at least one extensible HTTP header that specifies the content operation identifier including the directive to be performed by the device and an object identifier that specifies a location of the second content object.

Claim 12

12. (PREVIOUSLY PRESENTED) The method of claim 11, wherein the

content operation identifier further includes a second directive specifying purging a third content object from a cache.

Claims 13-26

Please cancel claims 13-26.

Claim 27

27. (CURRENTLY AMENDED) ~~The server of claim 20;~~ A server configured for providing content to a device according to Hypertext Transport Protocol (HTTP), the server comprising:

an interface configured for receiving an HTTP request for a first content object and outputting an HTTP response; and

an executable process configured for identifying a content operation identifier that identifies a corresponding second content object determined as relevant to the first content object by a predictive caching operation, the content operation identifier including a directive for prefetching the second content object as a content operation distinct from presentation of the first content object by the device, the executable process configured for supplying within the HTTP response the first content object and the content operation identifier, enabling the device to perform the prefetching of the second content object based on receipt of the content operation identifier within the HTTP response and distinct from the presentation of the first content object;

wherein the executable process is configured for adding to the first

content object a content operation tag that specifies the content operation identifier including a directive tag specifying the corresponding content operation to be performed by the device and an object identifier that specifies a location of the second content object.

Claim 28

28. (ORIGINAL) The server of claim 27, wherein the first content object is a Hypertext Markup Language (HTML) document, the executable process configured for inline prepending the content operation tag into the HTML document.

Claim 29

29. (PREVIOUSLY PRESENTED) The server of claim 28, wherein the content operation identifier further includes a second directive tag specifying purging a third content object from a cache.

Claim 30

30. (CURRENTLY AMENDED) The server of claim 20, A server configured for providing content to a device according to Hypertext Transport Protocol (HTTP), the server comprising:
an interface configured for receiving an HTTP request for a first content object and outputting an HTTP response; and
an executable process configured for identifying a content operation

identifier that identifies a corresponding second content object determined as relevant to the first content object by a predictive caching operation, the content operation identifier including a directive for prefetching the second content object as a content operation distinct from presentation of the first content object by the device, the executable process configured for supplying within the HTTP response the first content object and the content operation identifier, enabling the device to perform the prefetching of the second content object based on receipt of the content operation identifier within the HTTP response and distinct from the presentation of the first content object;

wherein the executable process is configured for inserting into the HTTP response at least one extensible HTTP header that specifies the content operation identifier including said directive to be performed by the device and an object identifier that specifies a location of the second content object.

Claim 31

31. (PREVIOUSLY PRESENTED) The server of claim 30, wherein the content operation identifier further includes a second directive specifying purging a third content object from a cache.

Claims 32-38

Please cancel claims 32-38.

Allowable Subject Matter

5. The following is an examiner's statement of reasons for allowance: The cited prior arts fail to disclose or suggest identifying a content operation identifier that identifies a corresponding second content object determined as relevant to the first content object by a predictive caching operation, the content operation identifier including a directive for prefetching the second content object as a content operation distinct from presentation of the first content object by the device; sending to the device an HTTP response to the HTTP request, the HTTP response including the first content object and the content operation identifier, enabling the device to perform the prefetching of the second content object based on receipt of the content operation identifier and distinct from the presentation of the first content object; and adding to the first content object a content operation tag that specifies the content operation identifier including a directive tag specifying the corresponding content operation to be performed by the device and an object identifier that specifies a location of the second content object, and in conjunction with all other limitations in the claim.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
